

Publications Output

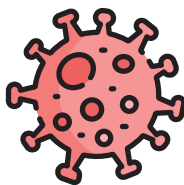

U.S. Trends and International Comparisons

The United States remains a highly influential nation in science and engineering (S&E) research, as measured by the volume of and citations to peer-reviewed publications.*

In 2020, roughly 35% of the world's internationally coauthored S&E research articles from selected journals had an author with an institutional address in the United States.

Global coronavirus research collaboration in 2020 was predominant among major research countries — the United States, China, the United Kingdom and many European Union countries.

*Publications refers to conference papers and peer-reviewed journal articles.
