The STEM Workforce of the United States

The science, technology, engineering, and mathematics (STEM) workforce is made up of individuals at all education levels who work in a wide variety of occupations. This workforce is defined by broad occupation type—science and engineering (S&E), S&E-related, and middle-skill occupations—and by educational attainment—either having at least a bachelor’s degree or not.

S&E occupations typically require a bachelor’s degree for entry and are broadly composed of workers who are computer and mathematical scientists; biological, agricultural, and environmental life scientists; physical scientists; social scientists; and engineers.

S&E-related occupations require STEM skills and expertise, but they do not fall into the five main S&E occupational categories listed above. The main occupational categories and positions that make up this group include health care workers, S&E managers, S&E precollege teachers, and technologists and technicians.

Middle-skill occupations require considerable STEM skills and expertise but do not typically require a bachelor’s degree for entry. These positions are primarily in the areas of construction trades, installation, maintenance, and production.

STEM workers with a bachelor’s degree or higher and those without such a degree are employed in all three broad occupation types (figure 1-A). However, their distribution tends to reflect the degree or training requirements of the occupations in each broad group. S&E occupations often require advanced education, so most of those workers have at least a bachelor’s degree (82%). In contrast, middle-skill occupations tend to require certification, licensing, or on-the-job training and thus have a high percentage of workers without a bachelor’s degree (85%).

Grouping STEM workers by educational attainment creates two workforce groups. The STEM workforce with at least a bachelor’s degree includes individuals who have attained a bachelor’s degree or higher and who work in S&E, S&E-related, or middle-skill occupations. These workers include engineers; software developers; physicians; registered nurses; industrial production managers; and farmers, ranchers, and other agricultural managers.

The STEM workforce without a bachelor’s degree, referred to as the skilled technical workforce, is comprised of workers in S&E, S&E-related, and middle-skill occupations that require a high-level of knowledge in a technical domain but do not require a bachelor’s degree. These workers hold positions such as computer support specialists, industrial engineers, licensed nurses, pharmacy technicians, carpenters, and electricians.
